

Problem Statement: Smart User Registration System

A company is creating a registration portal for new employees.

The system asks the user to enter the following information:

Enter Full Name: anuj kumar

Enter Email ID: anuj.kumar@company.com

The HR team wants the system to automatically validate and process the entered information.

Tasks

1. Display the employee's name in **uppercase**.
2. Display the employee's name in **title case**.
3. Count the total number of characters in the name.
4. Count the number of spaces in the name.
5. Check whether the email contains "@".
6. Check whether the email ends with ".com".
7. Extract and displays the company name from the email.
8. Replace all spaces in the employee name with underscores (_).
9. Check whether the employee's name starts with the letter "A".
10. Count how many times the letter "a" appears in the employee's name.

Sample Input

Name: anuj kumar

Email: anuj.kumar@company.com

Sample Output

ANUJ KUMAR

Anuj Kumar

Total Characters: 10

Spaces: 1

Valid Email: Yes

Ends With .com: Yes

Company Name: company

Name with Underscore: anuj_kumar

Starts With A: True

Count of 'a': 2
